updated: continuously

Oryx Feature Tour

This document exercises every rendering feature as it lands. Open it after each task and the newest section shows what just became visible. Emoji shortcodes render through font fallback:

Text Styles

Plain body text with **bold emphasis**, *an italic slant*, ~~struck through words~~, `inline code`, and a [link to Codeberg](#). Bold uses its own color, not only a heavier weight, and the same is true for italics, so themes control every style

independently.

This second paragraph is deliberately long enough to wrap on any reasonable window size, which makes the proportional margins and the line height rhythm visible: resize the window and the text reflows while the ten percent margins on each side hold their ratio. Consecutive lines inside one paragraph sit flush at exactly one and a half times the font size, while paragraphs are separated by space scaled to their weight.

Code

Inline code like `let x = 1` sits in a pill on the shared baseline.

```
// Comments are muted; keywords,  
strings, and numbers each take a hue.  
fn fibonacci(n: u64) -> u64 {
```

```
match n {  
    0 | 1 => n,  
    _ => fibonacci(n - 1) +  
    fibonacci(n - 2),  
}  
}
```

```
def greet(name: str) -> str:  
    """Docstrings count as  
    strings."""  
    return f"Hello, {name}!"
```

A fence with no language renders
plain, inside the same panel.

Quotes, Lists, Rules

A quoted paragraph gets its bar and a
tinted panel.

Consecutive quoted blocks read as one

region.

Nesting adds a second bar and deeper indent.

- An unordered item
 - Another, with **bold** and `code` inside
 - A nested item one step deeper
 - And a third level
1. First ordered item
 2. Second
 3. Third, so the marker column is visibly right-aligned
- ☒ A checked task
 - ☐ An unchecked task
-

The line above is a horizontal rule spanning the content width.

Alerts

Note

Useful information a reader should notice even when skimming.

Tip

A helpful suggestion for doing something better.

Important

Key information required to achieve a goal.

Warning

Urgent attention needed to avoid problems.

Caution

Consequences ahead; this one spans two blocks.

The panel and colored bar cover both paragraphs as one region.

Tables

Feature	Status	Notes
Headings	done	six independent hues
Code	done	syntect, pure Rust
Tables	new	header row, alternating stripes, and cells that wrap when one of them carries a longer sentence like this one
<code>inline code</code>	works	styles apply inside cells with bold too

A table with short content stays compact instead of stretching:

Key	Value
a	1
b	2

Images

The oryx mark, rendered inline at its natural size:

Vector images rasterize at their intrinsic size, the logo as SVG:

A broken path renders as a bordered placeholder with the alt text:

this image does not exist

Remote images fetch in the background and cache on disk; badges are SVG:

A remote raster image arrives the same way, replacing its placeholder:

An unreachable remote source keeps the alt

placeholder:

unreachable badge

Embedded HTML

Inline styling: **bold**, *italic*, H₂O, x², and Ctrl+T.

A break

via the br tag.

Footnotes and Math

Footnote references¹ render superscript in the link color and click-jump to their definition; here is a second one^{note} with a word label. The definitions collect at the end of the document under a rule, wherever they were written.

Inline math renders as a styled literal with simple scripts: $E=mc^2$, $a_i + b^{10}$, and x_{max} . Block math centers in a panel:

$$\sum_{i=1}^n i = n(n+1)/2$$

Links

External links open in the system browser: the [Oryx repository](#) lives on Codeberg. Bare autolinks work too: <https://example.com>.

Anchor links jump inside the document: back to [Text Styles](#), or down to [Heading Levels](#). The cursor turns into a pointer over any link.

Heading Levels

The copper ramp encodes hierarchy: the larger the heading, the warmer and brighter its color.

Level Four Recedes

Level Five Is Bold At Body Size

Level Six Is The Quietest

1. The first footnote definition, written mid-document.

note. The second definition, with the label rendered as its marker.
